

Press Release

Anti-spyware program triples in effectiveness

SI adds over 36,000 detections to Home Edition database

Lincoln, NE – February 8, 2006:

Schrock Innovations announced today that it will be releasing over 36,000 new spyware component detections for its Maintenance Checkup Home Edition product, bringing its total malware component library to over 50,000 detections. The release will bring the Home Edition in line with other top competitors in the anti-spyware marketplace.

The Maintenance Checkup Home Edition was created by Schrock Innovations to automate maintenance tasks and increase the security of its customer's computers. The application is powered by a database of spyware, adware and virus detections that identify undesirable software infecting a PC. Users can then use a one-button interface to remove the infections and clean their computers.

"The addition of these detections to the Home Edition's database marks a turning point for this application," Thor Schrock, Owner of Schrock Innovations said. "This database update, when coupled with the release of our new scanning engine, will make the MCHÉ a tier-one competitor in the marketplace and keep our customers safer than ever."

Schrock Innovations will be releasing a new version of the Home Edition in the second quarter of 2006. This new version will offer many new benefits, including home page protection, security level monitoring, support for Mozilla browsers, and an accessibility mode for the visually impaired. According to Schrock, the Home Edition will be closely tied with another major product offering in yet to be announced this year.

"We have some big plans for mid-2006, and the Maintenance Checkup Home Edition is a major tool that we will use to deliver high quality support to our customers in new and innovative ways."
